

Active solar energy availability

How does active solar heating work?

Active solar heating systems use solar energy to heat a fluid-- either liquid or air -- and then transfer the solar heat directly to the interior space or to a storage system for later use. If the solar system cannot provide adequate space heating, an auxiliary or back-up system provides the additional heat.

How much solar energy does the United States use?

Total solar energy use in the United States increased from about 0.02 trillion British thermal units (Btu) in 1984 to about 878 trillion Btu (or about 0.9 quadrillion Btu) in 2023. Solar electricity generation accounted for about 93% of total solar energy use in 2023 and solar energy use for space and water heating accounted for about 7%.
