Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the voltages supported and the power flowing.

Microgrids are categorized into DC microgrids, AC microgrids, and hybrid AC/DC microgrids [10].On the one hand, with the increasing proportion of DC output renewable energy sources such as photovoltaic power generation and DC loads such as energy storage units and electric vehicles in microgrids, DC microgrids have gradually received attention as a ...

DC coupling is efficient for energy storage but it can be less effective in powering AC loads. There are energy losses involved every time electricity stored as DC has been reconverted into AC for immediate use especially if much portion of the generated power goes directly towards domestic end uses.

Finally, DC systems allow easy integration of on-site energy sources such as solar or fuel cells or energy storage devices that generate DC power. In addition to the efficiency and cost arguments, DC also offers advantages in terms of power quality and system reliability,
