In the late 1800s, DC could not be easily converted to high voltages. As a result, Edison proposed a system of small, local power plants that would power individual neighborhoods or city sections. Power was distributed using three wires from the power plant: +110 volts, 0 volts, and -110 volts. Lights and motors

A distribution system may be classified according to: 1. Nature of current. According to nature of current, distribution system may be classified as: d.c. distribution system; a.c. distribution system; Now-a-days, a.c. system is universally adopted for distribution of electric power as it is simpler and more economical than direct current ...
