China's CATL, the world's largest battery producer, says its energy storage batteries can last for 25 years. Will it save the planet? Not on its own -- but grid-scale energy storage is part of the combination of clean energy technologies that is needed to reach net zero.

Are EVs the future of battery storage?

EVs accounted for over 90% of battery use in the energy sector, with annual volumes hitting a record of more than 750 GWh in 2023 - mostly for passenger cars. Battery storage capacity in the power sector is expanding rapidly.

Are battery storage and solar power complementary?

However, in some cases, the continued decline of wind and solar costs could negatively impact storage value, which could create pressure to reduce storage costs in order to remain cost-effective. "It is a common perception that battery storage and wind and solar power are complementary," says Sepulveda.

because consumers make their own energy; that increases rates for the rest, as there are fewer bill payors to cover the fixed investment in the grid, which still provides backup reliability for the solar customers. The solar customers are paying for their own energy but not paying for the full reliability of being connected to the grid.
