Grounding or earthing an electrical system is the process of connecting all metalwork/frame of electrical equipment i.e. the non-current carrying part or some electrical component of the system such as the neutral point in a star-connected system, one conductor of the secondary of a transformer, and so forth to the main body of earth.

Personnel grounding must limit the current to ground to less than 3 mA - the "soft grounding" method - to prevent injury from electric shocks and stray currents. Use specialized flooring and grounding fabrications worn on the wrists or over the shoes. Figure 6. The VESX45/PGS personnel grounding system with grounding straps.

System Grounding. System grounding refers to the limit of the defined values the voltage has to the ground in every part of the electrical system. It connects the current-carrying point of the electrical system to the ground, i.e., the neutral of transformers and rotating equipment as well as lines. Neutral Grounding
