2.2 Benefits of DC Coupling. The main advantage of DC coupling is higher overall system efficiency since the solar energy remains in DC format without unnecessary AC conversion steps. This avoids the 3~5% conversion losses that AC coupling introduces for each direction of energy flow (solar to battery, battery to loads).

The coupling method of photovoltaic energy storage is a key link to achieve efficient energy utilization. DC coupling method. Dc coupling is a common photovoltaic energy storage coupling method. In this way, the direct current generated by the photovoltaic power generation system is directly connected to the energy storage system.

This, alongside reduced cost efficiencies elsewhere, can erode any cost benefits from DC-coupling. Therefore, the preference for AC-coupling versus DC-coupling may come down to the operational benefits of each. For DC-coupling, the key to this benefit is in oversizing the solar farm - and the value of the subsequent "clipped" energy.

In DC coupling, the co-located solar and energy storage assets share the same interconnection, are connected on the same DC bus and use the same inverter. They are dispatched together as a single facility. DC coupling reduces efficiency losses, which occur when electricity current is converted, such as from DC to AC (Figure 1).

The installation of DC Coupled solutions in utility-scale energy storage, pioneered by Dynapower in 2018, has grown quickly in popularity.
