What is a tantalum capacitor used for?

Two primary functions that tantalum capacitors are ideally suited for are bulk energy storage and waveform filtering. In addition to maximum working voltage and voltage derating, an important characteristic of any capacitor is its ability to store an electrical charge. Some applications require the capacitor to store large amounts of charge.

Which capacitors are suitable for energy storage applications?

Tantalum and Tantalum Polymer capacitors are suitable for energy storage applications because they are very efficient in achieving high CV. For example, for case sizes ranging from EIA 1206 (3.2mm x 1.6mm) to an EIA 2924 (7.3mm x 6.1mm), it is quite easy to achieve capacitance ratings from 100mF to 2.2mF, respectively.

Why do tantalum capacitors have a high capacitance?

As the dielectric constant of the tantalum pentoxide and area of the plates are large, resulting in very high capacitance of a tantalum capacitor: The tantalum pellet along with the attached tantalum wire form the anode (positive) plate. The external anode lead wire is welded to the tantalum wire.

Can a tantalum capacitor be used in parallel?

In some cases, a single tantalum capacitor is sufficient, but in more demanding applications, multiple capacitors may be configured in parallel so that their capacitance values are cumulative and the combined resistance of the array is reduced. The second factor is the ESR of the capacitors.

Are solid tantalum capacitors a good investment?

Solid tantalum capacitor manufacturers can make improvements in physical design and materials that reduce the overall ESR of the capacitor. These lower ESR capacitors will lead to reductions in heat generation within the capacitor, thus improving overall circuit efficiency and long-term reliability.

What is a tantalum polymer (TaPoly) capacitor?

Tantalum and Tantalum Polymer (TaPoly) capacitors are also high CV devices, but extremely stable across temperature and voltage. Electrochemical Double Layer Capacitors (EDLC), commonly known as supercapacitors, are peerless when it comes to bulk capacitance value, easily achieving 3000F in a single element discrete capacitor.

capacitors have 2.5 times less inductance compared to the same nominal tantalum capacitors, which had L - 12.5 nH. This value is consistent with 10.9 nH for 5.6  $\mu$ F low ESR tantalum capacitors reported in [11]. Similar results were obtained in [18], where ceramic capacitors had lower ESL compared to tantalum parts of similar size.
