## Energy storage unit simulation circuit principle

The energy storage unit proposed by Raeber et al. (2021) contains an inductor, two capacitors, and four switching tubes, where each cell needs to be equipped with two switching tubes. Theoretically, this has a higher balancing efficiency, but the energy storage unit has a larger number of switch tubes, and the control complexity is higher.

Although sensible heat storage is the most common method of thermal energy storage, latent heat storage systems that use Phase Change Materials (PCMs) offer higher energy density (40-80 kWh/m 3) compared to water-based storage systems and also have the advantage of the isothermal nature of the storage process, i.e. storing heat compactly in a ...
