

What is a liquid air energy storage system?

An alternative to those systems is represented by the liquid air energy storage (LAES) system that uses liquid air as the storage medium. LAES is based on the concept that air at ambient pressure can be liquefied at -196°C , reducing thus its specific volume of around 700 times, and can be stored in unpressurized vessels.

Can a hybrid energy storage system improve thermal energy recovery?

Future prospective can aim to develop LAES hybrid solutions with an efficient thermal energy recovery system. Liquid air energy storage (LAES) represents one of the main alternatives to large-scale electrical energy storage solutions from medium to long-term period such as compressed air and pumped hydro energy storage.

Can a liquefaction plant provide both heating and cooling?

Al-Zareer et al. analysed the performance of a LAES able to provide both heating and cooling. The system exploited the waste thermal energy released during the air compression in the liquefaction plant of the system. In the case proposed, the heat of compression was recovered by low-pressure water and stored in a thermal energy storage (TES).

Why do we use liquids for the cold/heat storage of LAEs?

Liquids for the cold/heat storage of LAES are very popular these years, as the designed temperature or transferred energy can be easily achieved by adjusting the flow rate of liquids, and liquids for energy storage can avoid the exergy destruction inside the rocks.

What are liquid-cooled hybrid thermal management systems?
