The minimum speed of the flywheel is typically half its full speed, the storage energy is be given by $\frac{1}{2} I \omega^2$ where I is the rotor moment of inertia in kgm^2 and the ω maximum rotational speed in rad/s. The power level is controlled by the size of the M/G, so this is independent of the rotor.

Flywheel units are organized in clusters. Each flywheel unit has its power electronics, including power converter, motor controller, FPGA. The flywheel size (4-foot/1.2m diameter) is perfectly optimized to fit a cluster of 10 units inside a 20-foot container. Cables run from each flywheel unit to the associated power electronics rack.
