What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

What is the market potential of diurnal energy storage?

The market potential of diurnal energy storage is closely tied to increasing levels of solar PV penetration on the grid. Economic storage deployment is also driven primarily by the ability for storage to provide capacity value and energy time-shifting to the grid.

Is energy storage a viable resource for future power grids?

With declining technology costs and increasing renewable deployment, energy storage is poised to be a valuable resource on future power grids--but what is the total market potential for storage technologies, and what are the key drivers of cost-optimal deployment?

What are distributed energy resources?

Distributed energy resources (DERs) are small-scale energy resources usually situated near sites of electricity use, such as rooftop solar panels and battery storage. Their rapid expansion is transforming not only the way electricity is generated, but also how it is traded, delivered and consumed.

What could drive future grid-scale storage deployment?

By 2050, annual deployment ranges from 7 to 77 gigawatts. To understand what could drive future grid-scale storage deployment, NREL modeled the techno-economic potential of storage when it is allowed to independently provide three grid services: capacity, energy time-shifting, and operating reserves.

What are the benefits of distributed energy resources?

Distributed energy resources offer multiple benefits to consumers, support decarbonisation, and improve resilience. The primary beneficiaries of DERs are the consumers who own them. Distributed PV can supply affordable electricity to households and businesses, reducing their dependence on the grid.

In July 2021 China announced plans to install over 30 GW of energy storage by 2025 (excluding pumped-storage hydropower), a more than three-fold increase on its installed capacity as of 2022. Researchers agree that distributed generation (DG) has a role to play in the future of electricity systems [2, 3] in addition to energy storage and demand response. However, the degree of change in future electricity systems is uncertain as it depends largely on the level of deployment of DG and other distributed energy resources (DERs).
