During the development of the new generation of energy systems, such as aero engine, and nuclear power system, it is found that applying compact heat exchangers (CHEs) considerably increases the efficiency of the systems.

The concrete block heat storage system integrates heat exchange tubes permanently embedded within the concrete blocks, enabling the HTF to exchange heat with the concrete. However, concrete is susceptible to cracking during charge/discharge cycles [20], thereby impacting system operation, and its maximum operating temperature of 400-450 °C ...

Sensible heat thermal energy storage materials store heat energy in their specific heat capacity (C_p). The thermal energy stored by sensible heat can be expressed as $Q = m \cdot C_p \cdot \Delta T$ where m is the mass (kg), C_p is the specific heat capacity ($\text{kJ} \cdot \text{kg}^{-1} \cdot \text{K}^{-1}$) and ΔT is the raise in temperature during charging process. During the ...

[14, 43] For immersed heat exchanger and macroencapsulated systems, the stability and compatibility of the PCM and the heat exchanger systems are essential. [13, 44] Depending on the material class, also the PCM itself can suffer from degradation, which is reflected in impaired storage behavior like reduced melting enthalpy and temperatures ...

Latent heat storage systems store energy without the medium changing in temperature but rather depends on the changing state of a medium. So called "phase change materials" have been developed, which can store heat in their mass as latent heat. These materials are commonly used in solar applications and building materials, where they absorb ...

The company's heat storage system relies on a resistance heater, which transforms electricity into heat using the same method as a space heater or toaster--but on a larger scale, and reaching a ...
