The largest inductor ever known to me was Fermi National Accelerator Lab's Tevatron magnet. If memory serves it was 1000 Henries running continuously at 1400 DC Amperes. Energy storage must have been right around 1 GigaJoule. They had a "quench resistor" designed to burn off the energy in case the magnet would develop an open circuit.

Inductors and capacitors are energy storage devices, which means energy can be stored in them. But they cannot generate energy, so these are passive devices. The inductor stores energy in its magnetic field; the capacitor stores energy in its electric field. ...

Inductors are amazing energy storage elements that convert electrical energy into magnetic energy for storage. It's similar to a transformer, but the inductor has only one winding, which makes it even more special! An inductor is an amazingly versatile component that can be constructed in a variety of ways. The most common structure is a ...

Inductance Value: Measured in henries (H), this value reflects the energy storage capability of the component. This magnetic energy storage property makes inductors essential for a range of applications in electronics and power systems.

Types of Inductive Devices. Inductors come in a variety of forms, each optimized for specific uses.

The Circuit Up: Inductance Previous: Self Inductance Energy Stored in an Inductor Suppose that an inductor of inductance is connected to a variable DC voltage supply. The supply is adjusted so as to increase the current flowing through the inductor from zero to some final value. As the current through the inductor is ramped up, an emf is generated, which acts to oppose the ...

How Does an Inductor Store Energy? Inductors store energy in the form of a magnetic field. The inductor generates a magnetic field that stores energy as current passes through the wire coil. Many electronic devices use inductors for energy storage and transfer because they allow the stored energy to be released back into the
