What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

What are the different types of batteries?

Batteries are mature energy storage devices with high energy densities and high voltages. Various types exist including lithium-ion (Li-ion), sodium-sulphur (NaS), nickel-cadmium (NiCd), lead acid (Pb-acid), lead-carbon batteries, as well as zebra batteries (Na-NiCl<sub>2</sub>) and flow batteries.

What types of energy storage systems are suitable?

Pumped hydro energy storage systems and compressed air energy storage systems are suitable for load levelling, peak generation, conventional spinning reserve, renewable integration and renewables back-up applications. The compressed air energy storage systems are also suitable for emergency back-up applications.

What types of batteries are used in power applications?

Power applications involve comparatively short periods of discharge (seconds to minutes), short recharging periods and often require many cycles per day. Secondary batteries, such as lead-acid and lithium-ion batteries, can be deployed for energy storage, but require some re-engineering for grid applications.

Auxiliary services such as PM and FM are becoming increasingly popular in China due to its fast response time, high response accuracy, and low start-stop costs [[5], [6], [7], [8]]. Furthermore, as the status of independent energy storage in China is clarified, energy storage may be able to generate revenue by participating directly in the auxiliary services market.
