In the existing energy storage technology, advanced adiabatic compressed air energy storage (AA-CAES) technology has broad application prospects because of its advantages of low pollution, low investment, flexible site selection, and large capacity. ...

The usage of compressed air energy storage (CAES) dates back to the 1970s. The primary function of such systems is to provide a short-term power backup and balance the utility grid output. [2]. At present, there are only two active compressed air storage plants. The first compressed air energy storage facility was built in Huntorf, Germany.

Compressed-air energy storage (CAES) plants operate by using motors to drive compressors, which compress air to be stored in suitable storage vessels. The energy stored in the compressed air can be released to drive an expander, which in turn drives a generator to produce electricity. Compared with other energy storage (ES) technologies, CAES ...

Motivated by the suboptimal performances observed in existing compressed air energy storage (CAES) systems, this work focuses on the efficiency optimization of CAES through thermal energy storage (TES) integration. The research explores the dependence of CAES performance on power plant layout, charging time, discharging time, available power, and ...

The main reason to investigate decentralised compressed air energy storage is the simple fact that such a
