Can iron-based aqueous flow batteries be used for grid energy storage?

A new iron-based aqueous flow battery shows promise for grid energy storage applications. A commonplace chemical used in water treatment facilities has been repurposed for large-scale energy storage in a new battery design by researchers at the Department of Energy's Pacific Northwest National Laboratory.

How do flow batteries store energy?

Flow batteries, like the one ESS developed, store energy in tanks of liquid electrolytes--chemically active solutions that are pumped through the battery's electrochemical cell to extract electrons. To increase a flow battery's storage capacity, you simply increase the size of its storage tank.

Are flow batteries a viable alternative to lithium-ion storage systems?

High-tech membranes, pumps and seals, variable frequency drives, and advanced software and control systems have brought greater efficiencies at lower expense, making flow batteries a feasible alternative to lithium-ion storage systems. Each flow battery includes four fuel stacks in which the energy generation from the ion exchange takes place.

What is an iron-based flow battery?

Iron-based flow batteries designed for large-scale energy storage have been around since the 1980s, and some are now commercially available. What makes this battery different is that it stores energy in a unique liquid chemical formula that combines charged iron with a neutral-pH phosphate-based liquid electrolyte, or energy carrier.

A comparative overview of large-scale battery systems for electricity storage. Andreas Poullikkas, in Renewable and Sustainable Energy Reviews, 2013. 2.5 Flow batteries. A flow battery is a form of rechargeable battery in which electrolyte containing one or more dissolved electro-active species flows through an electrochemical cell that converts chemical energy directly to electricity.

A typical flow battery consists of two tanks of liquids which are pumped past a membrane held between two electrodes. [1]A flow battery, or redox flow battery (after reduction-oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane.
