At high demand, water is passed through the tunnel at a rate of up to 852 m³/s to drive six generators.

What are the storage elements of an energy system?

The existing energy system uses two primary storage elements: heat storage in combined heat and power (CHP, or cogeneration) systems, and water reservoirs in hydro power systems. A CHP plant must meet demand profiles for both heat and electricity.

In physics, energy density is the quotient between the amount of energy stored in a given system or contained in a given region of space and the volume of the system or region considered. Often only the useful or extractable energy is measured. It is sometimes confused with stored energy per unit mass, which is called specific energy or gravimetric energy density.
