Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including the US, Australia and Germany. Thermal energy storage is predicted to triple in size by 2030. Mechanical energy storage harnesses motion or gravity to store electricity.

It was reported that the optimal design solution of energy systems in buildings was affected by EV demand, particularly for small-scale buildings. Using improved K-means clustering for scenario reduction, a solar PV system with a hybrid energy storage system was optimized by Guo et al. [3]. It was shown that this approach could accurately ...

The book chapter focuses on the complexities of Phase Change Materials (PCMs), an emerging solution to thermal energy storage problems, with a special emphasis on nanoparticle-enhanced PCMs (NePCM). The first sections provide a ...

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

1. Introduction. In order to mitigate the current global energy demand and environmental challenges associated with the use of fossil fuels, there is a need for better energy alternatives and robust energy storage systems that will accelerate decarbonization journey and reduce greenhouse gas emissions and inspire energy independence in the future.

The purpose of Energy Storage Technologies (EST) is to manage energy by minimizing energy waste and improving energy efficiency in various processes [141]. During this process, secondary energy forms such as

heat and electricity are stored, leading to a reduction in the consumption of primary energy forms like fossil fuels [142].

The challenge of advancing storage involves both short and long-term strategies. In the long term, a regulatory and economic framework must support research, development, and deployment of seasonal storage technologies. Some thermal energy solutions, like aquifer and pit thermal energy storage, are already mature, but others can be incentivized.

Moreover, as demonstrated in Fig. 1, heat is at the universal energy chain center creating a linkage between primary and secondary sources of energy, and its functional procedures (conversion, transferring, and storage) possess 90% of the whole energy budget worldwide [3]. Hence, thermal energy storage (TES) methods can contribute to more ...
