

Solar water heating systems, or solar thermal systems, use energy from the sun to warm water for storage in a hot water cylinder or thermal store. Because the amount of available solar energy varies throughout the year, a solar water heating system won't provide 100% of the hot water required throughout the year.

Solar hot water systems capture thermal energy from the sun and use it to heat water for your home. The High Pressure Coal Boiler produces 300 L/s of steam, a much better number, but still only equivalent to 7.5 EU/t. Like the Small Coal Boilers, these run off coal or charcoal. The Simple Solar Boiler produces the same amount of steam as a Small Coal Boiler, but runs off sunlight.

Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including the US, Australia and Germany. Thermal energy storage is predicted to triple in size by 2030. Mechanical energy storage harnesses motion or gravity to store electricity.

NYSERDA's Retail Energy Storage Incentive provides commercial customers funding for standalone, grid-connected energy storage or systems paired with a new or existing clean on-site generation like solar, fuel cells, or combined heat and power. Energy storage systems must: Be sized up to 5 megawatts (MW) of alternating current (AC) power
