What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

Are batteries a viable energy storage technology?

Batteries have already proven to be a commercially viable energy storage technology. BESSs are modular systems that can be deployed in standard shipping containers. Until recently, high costs and low round trip efficiencies prevented the mass deployment of battery energy storage systems.

Do battery energy storage systems cost a lot?

Although cell costs have decreased, batteries continue to be the main cost of battery energy storage systems. Household battery energy storage systems are used to boost, for example, the photovoltaic systems' capacity for self-consumption, also known as energy-time shift.

What is the storage capacity of a battery system?

Battery systems typically have storage capacities ranging from 1 to 30 kWh for household applications to MWh for industrial battery systems. At the same time, battery degradation occurs during the charging and discharging processes, which limits the battery's lifetime.
