1 INTRODUCTION. Buildings contribute to 32% of the total global final energy consumption and 19% of all global greenhouse gas (GHG) emissions. 1 Most of this energy use and GHG emissions are related to the operation of heating and cooling systems, 2 which play a vital role in buildings as they maintain a satisfactory indoor climate for the occupants. One way ...

FESS has a unique advantage over other energy storage technologies: It can provide a second function while serving as an energy storage device. Earlier works use flywheels as satellite attitude-control devices. A review of flywheel attitude control and energy storage for aerospace is given in [159].

Many people see affordable storage as the missing link between intermittent renewable power, such as solar and wind, and 24/7 reliability. Utilities are intrigued by the potential for storage to meet other needs such as relieving congestion and smoothing out the variations in power that occur independent of renewable-energy generation.
