What is a Megapack energy storage system?

Megapacks are designed for large-scale energy storage. Megapacks are used by utilities to replace peaker power plants, which generate energy during periods of peak demand. Megapacks store grid energy rather than generating it from fuel.

What is energy storage?

Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. Some technologies provide short-term energy storage, while others can endure for much longer. Bulk energy storage is currently dominated by hydroelectric dams, both conventional as well as pumped.

What are the different types of energy storage?

Energy comes in multiple forms including radiation, chemical, gravitational potential, electrical potential, electricity, elevated temperature, latent heat and kinetic. Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms.

How much energy can a Megapack store?

Each unit can store over 3.9 MWh of energy--that's enough energy to power an average of 3,600 homes for one hour. Each Megapack unit ships fully assembled and ready to operate, allowing for quick installation timelines and reduced complexity. Systems require minimal maintenance and include up to a 20-year warranty.

What is a powerpack & how does it work?

Each Megapack comes from the factory fully-assembled with up to 3 megawatt hours (MWhs) of storage and 1.5 MW of inverter capacity, building on Powerpack's engineering with an AC interface and 60% increase in energy density to achieve significant cost and time savings compared to other battery systems and traditional fossil fuel power plants.
