

How to perform propylene epoxidation using O₂?

To perform propylene epoxidation using O₂, the overall reaction should be performed by three catalysts--a photocatalyst for photovoltage generation, an electrocatalyst for selective O₂ reduction to H₂O₂ and a heterogeneous catalyst for propylene epoxidation with in situ-generated H₂O₂ (Fig. 1).

Does a catalytic system produce propylene oxide?

It stably produces propylene oxide for 24 h with high selectivity ($\geq 98\%$) under ambient conditions. These results demonstrate the potential of this catalytic system to produce chemical compounds in an environmentally benign manner.

Can a Photo-Electro-heterogeneous catalytic system produce propylene oxide?

The direct epoxidation of propylene using O₂ is considered among the most promising means of producing propylene oxide. Here we report an integrated photo-electro-heterogeneous catalytic system for propylene epoxidation with O₂. Bismuth vanadate (or TiO₂) photocatalyst and a Co-based electrocatalyst produces H₂O₂.

Does a stable surface oxametallacycle produce ethylene oxide?

Linic, S. & Barteau, M. A. Formation of a stable surface oxametallacycle that produces ethylene oxide. J. Am. Chem. Soc. 124, 310-317 (2002).

Is hydrogen peroxide a suitable oxidizing agent for propylene epoxidation?

Recently, a propylene epoxidation process using hydrogen peroxide (H₂O₂) as an oxidizing agent (hydrogen-peroxide/propylene-oxide, HPPO) has received substantial attention because this process shows high PO selectivity ($\geq 95\%$) and generates water as the only coproduct ¹¹.

What is the energy barrier for the dehydrogenation of propylene?

In addition, the energy barrier for the dehydrogenation of propylene is 1.50 eV on (100) facets of Ag₃PO₄, which is higher than that (1.27 eV) for the OH-correlated pathway (Supplementary Fig. 16).

Propylene (C₃H₆) is a colorless gas. It is obtained by thermal cracking of ethylene. At low concentration it forms an explosive and flammable mixture with air, while at high concentrations it can cause asphyxiation and skin burns. ... propylene oxide and other chemicals. The structural polymorphism of block copolymers is greatly enhanced by the addition of solvents that interact selectively with different polymer blocks [1,2]. For example, at a certain block composition, the self-assembled structure is fixed in the absence of a solvent, but it can be modified in the presence of a selective solvent due to the swelling of one type of block ...

Introduction. Electrochemical energy storage in batteries is crucial for successfully transitioning from fossil fuel usage to a sustainable energy economy. 1 Lithium-ion batteries (LIBs) exhibit a high energy density and operating voltage while maintaining a sufficiently long cycle life. Thus, LIBs have established themselves as the prime non-stationary energy ...

The LIBs with high security, reliability, long lifetime and low cost are considered as the most promising energy storage systems in the field of portable electrochemical devices, electric vehicles market and grid energy ... (propylene carbonate) (PPC), a copolymer of propylene oxide and carbon dioxide, has gained considerable interests ...

Propylene oxide (PO; chemical formula C_3H_6O ; IUPAC nomenclature: 2-methyloxirane molar mass 58.08 gmol⁻¹, Fig. 1.1) is a colourless, low boiling liquid with a pleasant, ethereal odour [] is an important building-block chemical that is used to produce numerous commercial materials [2, 3]. As an example, approximately 70% of the PO is used as an intermediate to synthesise ...

Mechanical, electrical, chemical, and electrochemical energy storage systems are essential for energy applications and conservation, including large-scale energy preservation [5], [6]. In recent years, there has been a growing interest in electrical energy storage (EES) devices and systems, primarily prompted by their remarkable energy storage ...

Propylene is also starting to gain attention in the energy sector. Its chemical structure allows it to be used as a potential source of clean, renewable energy. Specifically, the concept of using propylene as a storage medium

Propylene oxide energy storage

for excess renewable energy is being explored.

Energy is the lifeblood of modern society. Global warming, finite supplies of fossil fuels and city pollution conspire to make the use of renewable energy, together with electric transportation, a global imperative []. The increased and extreme dependency of humans in recent years on fossil fuels of finite supply, and uneven global distribution, had led to two problematic ...

2, 4 Also, while a hydrogen peroxide to propylene oxide process has been gaining market share, direct gas-phase epoxidation of propylene is still preferable. 4 From an academic standpoint, the ...

Global production of propylene oxide is estimated at 12MTpa in 2022, implying a \$25bn pa market at an average propylene oxide cost of \$2/kg.. Propylene oxide production costs are modeled in this data-file, and most likely run at \$2/kg (\$2,000/ton to derive a 10% IRR at a plant costing \$1,500/Tpa.. Specifically we have modeled the HPPO process, forming propylene oxide via the ...

Propylene Oxide (PO) is an extremely versatile chemical intermediate used to produce a wide range of industrial and commercial products. Propylene oxide is a colorless, low-boiling point and highly volatile liquid with a sweet, ether-like odor. It is highly flammable and reactive; storage and unloading areas must be appropriately designed and monitored.

The increasing need for electrochemical energy storage drives the development of post-lithium battery systems. Among the most promising new battery types are sodium-based battery systems. However, like its lithium predecessor, sodium batteries suffer from various issues like parasitic side reactions, which lead to a loss of active sodium inventory, thus reducing the ...
