Virtual power plants are emerging as an important part of the mix, harnessing the collective power of Australia's behind-the-meter energy assets. How do virtual power plants work?

Are virtual power plants better than new power plants?

Virtual power sources typically are quicker to site and build, and can be cleaner and cheaper to operate, than new power plants. Virtual power plants are more resilient against service outages than large, centralized generating stations because they distribute energy resources across large areas. Virtual power plants aren't new.

Could virtual power plants reshape electric power?

Virtual power plants could help reshape electric power into an industry that's more nimble, efficient and responsive to changing conditions and customers' needs. Some power plants don't have massive smokestacks or cooling towers - or even a central site.

Why are virtual power plants more resilient than centralized generating stations?

Virtual power plants are more resilient against service outages than large, centralized generating stations because they distribute energy resources across large areas. Virtual power plants aren't new. The U.S. Department of Energy estimates that there are already 30 to 60 gigawatts of them in operation today.

Not just solar batteries...maybe a virtual power plant. While household solar batteries are an early focus, the term "virtual power plant" can refer to energy pooled from a wide range of energy assets or generators. Electric vehicles offer a significant opportunity, which is currently being trialled by ACT energy provider ActewAGL to ...
