Does supercritical water change its properties?

As pointed out in numerous studies (3 - 5), water's properties exhibit dramatic changes under supercritical conditions: the fraction of HB molecules greatly decreases with respect to ambient P and T, and there appears to be a consensus on the persistence of some HBs up to at least 600 °C and 134 MPa (3).

Is water a supercritical fluid?

Water, the fluid of life at ambient pressure (P) and temperature (T), is mostly present under supercritical conditions in the Earth's crust and mantle (1): that is, above the vapor-liquid critical point (647 K and 221 MPa).

What is the energy of a non-rigid supercritical fluid?

In the proposed theory, the energy of the non-rigid supercritical fluid per particle includes the contribution from the kinetic energy, E_k , and the potential energy of the longitudinal phonons with wavelengths larger than λ . Using the equipartition theorem, where E_l is the energy of the longitudinal phonons, we write
