

# What planet near moon

What planet is very close to the Moon?

There are two planets trailing the Moon but I wouldn't call either of them next to the Moon. The closest and brightest one is Jupiter and slightly east is Saturn. If your horizon is clear you should also see Mars rising right now.

What planets are next to Moon?

The planets Venus, Mars and Saturn appear close together in the southeast predawn sky, while the moon passes near the bright stars Castor and Pollux on April 9. Look up at the sky before sunrise Saturday (April 9) to see a trio of planets, twin stars and ...

What is the brightest star near the Moon?

They are all "first magnitude" stars. But the brightest "stars" that you may spot near the Moon are not going to be stars at all, but rather the planets Venus, Mars, Jupiter and Saturn.

Is the Moon the closest planet to the Earth?

The Ptolemaic system used in Greek astronomy placed the planets in order, closest to Earth to furthest, as the Moon, Mercury, Venus, Sun, Mars, Jupiter, and Saturn. In addition the day was divided into seven hour intervals, each ruled by one of the planets, although the order was staggered (see below).

Uranus rise and set in Dublin. Most of the night until sunrise. Bring binoculars. Uranus is visible during most of the night, but it is best viewed in the early morning hours and until sunrise.

In our entire solar system, the only object that shines with its own light is the Sun. That light always beams onto Earth and Moon from the direction of the Sun, illuminating half of our planet in its orbit and reflecting off the surface of the Moon to create moonlight. Sometimes the entire face of the Moon glows brightly.

The Moon can be full and new, waxing and waning, a thin crescent or a fully-illuminated disk. Once in a while, it can even become a Supermoon, or a Blood Moon! Each month's Full Moon has its own peculiar names given to it ...
