Iron-based flow batteries designed for large-scale energy storage have been around since the 1980s, and some are now commercially available. What makes this battery different is that it stores energy in a unique liquid chemical formula that combines charged iron with a neutral-pH phosphate-based liquid electrolyte, or energy carrier.

Savinell and his team at CWRU are working on a prototype decoupled iron-flow battery to store power generated from grid-scale wind and solar facilities in a scalable and cost-efficient manner. "When renewable energy reaches approximately 15 to 20% of total power generation, utility-scale storage is required," says Savinell.
